

BEACH BOULEVARD DRAINAGE

Project included removal and replacement of 27 concrete pipe drainage outfalls, 5 sheet piles open water outfalls, and repair of 2 open water outfall sheet pile caps, all damaged due to Hurricane Katrina.

Over 6700 linear feet of reinforced concrete pipe and over 35000 square feet of vinyl sheet pile were used to construct the project. The project was constructed at a cost of just over \$1,375,000.00, and was funded by FEMA grant.

This project restores function to clogged and broken drainage passages allowing storm water to drain from inland areas to the bay, thereby alleviating flooding in nearly 2200 acres of residential and business areas in Bay Saint Louis and Waveland.
